At least three significant observations that emerged through testing and write 1 - 3 sentences on each.

1. The buttons were easily seen and made it easy to advance to the next slide. That was a key point that I wanted to make sure was known and the placement made sense along with the answer buttons.

2. The questions were not completely finished yet but they were able to get the idea of what they were getting at. This is the main area I will focus on improving as this was just the first draft so far.

3. Testers liked the visuals and thought they fit in with the theme specifically on the expressive design sign. They would like to see more interactiveness which I plan to add (i.e spinning animation or slight movement)
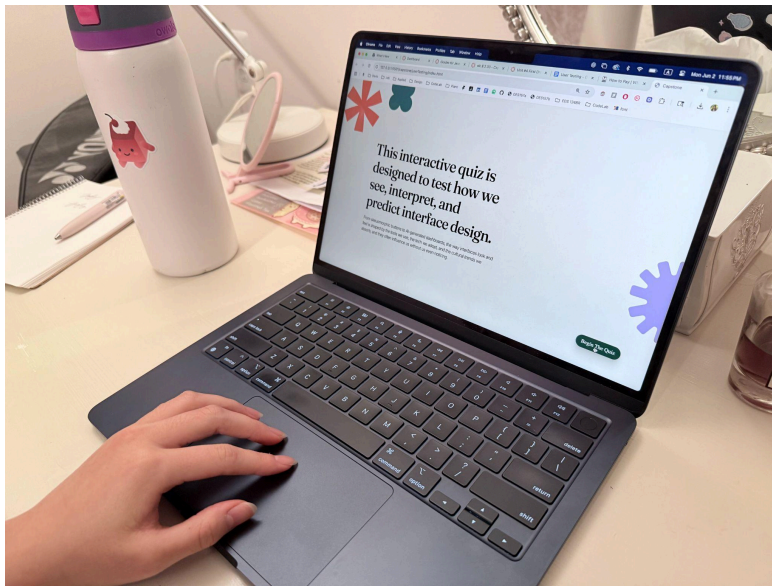

Address these questions:

1. Identify aspects of your project that need to be improved.
   - The questions were still being fleshed out so that was the main area of concern. Showing the polling at the end will also be improved as right now they don't have any labels or clear indication of what it is.

2. Can users figure out how to navigate/interact with your project?
   - Yes, the navigation was very straightforward

3. Does the project impact the user the way you want it to? (Does it have the right message or communicate what you want it to?)
   - I think so. When the visuals and questions are more polished, it will prompt users to think about their choices and then being able to see others' answers in the end will contribute to their reflection about their perception of certain design trends.

4. What modifications need to be made to interactions, visuals or other elements of the project to make it stronger?
   - I really want to add more animations in the transitions to make the entire experience very smooth and seamless. The polling at the end will also

have to be modified to more clearly show the stats of the other people's answers. I also want to add some text for context in the results page.

5. Plan of how you will update your capstone project based on the feedback.
   - Make the answer buttons a different color or hover state compared to the submit button, possibly add a back button, add more text and labels on the results page

User Tester #1 (Tested with someone at home as I wasn't ready for testing last class)
